> e-mail:unekecj@yahoo.com September, 2025.

#### **Executive summary**

The report presents the outcome of impact assessment study of borehole water provided to some rural communities of Ebonyi State especially in Ohaukwu LGA by **Samuel Omogo Foundation**. This report is designed to provide information on how the boreholes have impacted on the lives of the target communities with the view to initiating the process that will lead to sustainable water availability to the rural dwellers. All the rural communities assessed are located in Ohaukwu LGA. The following water availability impact assessment methodology/procedure was employed. The following were undertaken: (i). Obtaining list of selected communities where boreholes were drilled from the **Samuel Omogo Foundation**, (ii). Contacting the proposed well managers, (iii). Visitation of the different site, (iv). Obtaining pictures of sources of water and picture of the commissioning of the boreholes drilled in target communities, (v) Interviewing the well managers and other community members, (vi). Presentation of the findings. **The summary of key findings are as follows:** 

- 1. Water scarcity is clearly a very serious problem in all the communities listed.
- 2. The communities all have sizable population with average household comprising up to 10persons.
- 3. The main sources of water supply are pond, rivers and streams and these are about 1hr to as much as three hours of walking distance away from the villages.
- 4. Majority of the water sources are being contaminated by sewage (faeces and urine), animal dung, refuse and plat debris and leaves. The possibility of chemical contaminants cannot be ruled out as some people wash clothes and other items capable of polluting the water sources right inside the water.
- 5. The major risks reported include snake bites, attack by hoodlums and thieves, rape of women and girls, molestation by wild animals including monkeys, children going to school late and with dirty uniforms and fighting at the water source.
- 6. Majority of the members of the communities access the water sources on foot.
- 7. The water obtained from all the sources were described as unacceptable.
- 8. The women and the children are mainly responsible for fetching of the water in all the communities.
- 9. All the water sources dry up towards the beginning of the dry season especially around November-April each year.
- 10. The major water-borne diseases suffered by the people as a result of water scarcity include: Typhoid, Cholera and dysentery. Before the provision of the boreholes, the prevalence of these diseases was very high and there were regular outbreaks of these diseases in the target communities.
- 11. All the community members and well managers interviewed acknowledged that the boreholes have greatly alleviate the suffering of their people, reduced exposure to disease causing water-borne infectious agents and enhanced personal hygiene.
- 12. All the managers noted that adequate arrangements have been made to manage and maintain the boreholes since they were drilled. Some of the maintenance activities initiated by the managers and the communities included: constituting a borehole management committee, providing security to monitor and regulate the usage of the boreholes.
- 13. The commissioning of the boreholes was successful and beneficiaries express gratitude to the philanthropists who provided the boreholes to them through the Samuel Omogo Foundation.

#### **Key findings**

Information obtained on cases reported at the major health facilities in the area (Ngbo Court Health Centre) in Ohaukwu LGA diagnosed as water borne disease presenting as typhoid or cholera with symptoms of diarrhea, dysentery, vomiting. i.e., comprehensive assessment from January 2024 to December 2024, showed an increase to 327 cases from the previous 18 cases reported in 2023.

Year	Cases of water borne diseases
January 2015 to December 2015	199
January 2021 to December 2021	85
January 2022 to December 2022	20
January 2023 to December 2023	18
January 2024 to December 2024	327

#### **NOTE:**

Unfortunately, the cases of water borne diseases increased tremendously from the 18 cases reported in 2023 to an unprecedented number of 327 as of December 2024.

#### POSSIBLE CAUSE OF THE TREMENDOUS INCREASE IN WATER BORNE DISEASES

Following the bloody Ezza-Effium/Effium communal clash, there has been unprecedented increase in the number of internally displaced persons which has resulted in increase in make shift displacement camps without water. Also the increase in the number of displaced persons who have migrated towards the Ngbo Court area who are also lacking clean water also contributed to the increase in the water borne diseases.

## **RECOMMENDATION**

There is need for the provision of more boreholes particularly in locations where the displaced people are concentrated. This will help to improve the risk of water borne diseases among the displaced populations.

#### **Background information on Ebonyi State**

Ebonyi State is one of the states in the South-eastern Nigeria. It is the youngest state in the South-eastern Nigeria and is made up of 13 Local Government Areas (LGAs). Known as the "Salt of the Nation" because of its large salt deposits, Ebonyi State is one of the 36 states in Nigeria. It was created in 1996, making it one of the youngest states in Nigeria. The State shares a border with Benue State to the North, Enugu State to the west, Imo and Abia States to the south and Cross River State to the east.

Map of Nigeria with Ebonyi State highlighted in orange

The State capital and largest town is Abakaliki. The second largest town is Afikpo. Other towns are Ikwo, Izzi, Onicha, Edda, Onueke, Ezzamgbo, Nkalagu, Uburu, Ishiagu, Amasiri and Okposi. For administrative purposes, Ebonyi State is divided into three Senatorial Zones, each represented by a Senator at the National Assembly, and six Federal Constituencies, each represented by a Member of the House of Representatives also at the National Assembly.

The three Senatorial Zones are:

- Ebonyi North comprising Abakaliki, Ebonyi, Ishielu, Ohaukwu and Izzi LGAs
- Ebonyi Central comprising Ikwo, Ezza North and Ezza South LGAs
- Ebonyi South comprising Afikpo North, Afikpo South, Ivo, Ohaozara and Onicha LGAs

Map showing Ebonyi Local Government Areas and Senatorial Zones

The state is also divided into thirteen local government areas (LGAs), namely: (1) Abakaliki, (2) Afikpo North, (3) Afikpo South, (4) Ebonyi, (5) Ezza North, (6) Ezza South, (7) Ikwo, (8) Ishielu, (9) Ivo, (10) Izzi, (11) Ohaozara, (12) Ohaukwu and (13) Onicha.

Ebonyi State is situated between latitudes 5°40' and 6° 54'N and longitudes 7°30'and 8°30'E, it is bounded to the north by Benue State, to the east by Cross River State, to the south by Abia State and to the west by Enugu State. Geopolitically, it belongs to the South East Zone of Nigeria but lies entirely in the Cross River Plains. Its elevation is between 125 and 245 meters above sea level, mainly of broad clay and shady basins fringed by narrow outcrops of sandstone, limestone and other rock formations. Towards the southeast border, the landscape abuts onto the hilly country of the Okigwe-Arochukwu axis.

The population of the State was put at 2,176,947 by the 2006 census. With a growth rate of 3.5% per annum, the State has a projected population of 2,565,184 by the end of 2012. Males constitute 48.9% while females constitute 51.1% of the population. The average population density is 286 persons per square km but is higher in the urban areas. A further breakdown of the population shows that Infants (under one year) old make up 4%, the U5 children 20% and women of child bearing (WCBA) (15-49 years) make up 22% of the population. Ebonyi is mainly rural and so, about 75% of the population lives in the rural areas.

The people of Ebonyi State are predominantly farmers and traders. The main crops produced in the State are rice, yam, palm produce, cocoa, maize, groundnut, plantain, banana, cassava, melon, sugar cane, beans, fruits and vegetables. Fishing is also carried out in Afikpo. The state is blessed with mineral resources such as lead, limestone, zinc and marble. Ebonyi is called "the salt of the nation" for its huge salt deposit at the towns of Okposi and Uburu.

In the industrial sector, the State has several food processing factories including dozens of rice mills, many quarry factories, a fertilizer blending plant, one of Nigeria's largest poultries (Nkali Poultry) and one of Nigeria's foremost cement factories (the Nigerian Cement Company at Nkalagu). Educationally, the State boasts of a university in Abakaliki (Ebonyi State University, popularly known as EBSU), a federal polytechnic (AkanuIbiam Federal Polytechnic in Unwana near Afikpo), one college of education in Ikwo, a college of agriculture in Ishiagu and several secondary and primary schools spread across the various towns and villages. Ebonyi students consistently rank high in educational tests and other achievement scores.

In the health sector, Ebonyi has The Federal Teaching Hospital, and the National Obstetrics Fistula Centre – both in Abakaliki. The State also has general hospitals located in various parts of the State. These are complemented by several private hospitals and clinics in various towns and villages. Tourist attractions in the State include Ndibe Beach in Afikpo, the salt lakes in the towns of Okposi and Uburu, and Ishiagu Pottery Works in Ishiagu. Ebonyi State has a rich cultural heritage. This is expressed in the many colorful cultural dances, folklore and artwork, some of which have attracted national and international attention. The popular NkwaUmuagbogho Dance Group of Afikpo has won several national and international merit awards. Other popular dance groups include the official State Government cultural dance group, NkwaNwite of Afikpo, Ojianyalere of Amasiri and many more.

#### Borehole water impact assessment methodology

Survey was conducted in selected benefitting communities with emphasis at Ohaukwu LGA. The following were undertaken:

- 1. Obtaining list of selected communities for borehole drilling: The list of the communities where the boreholes were drilled were obtained from Samuel Omogo Foundation. The list contained the selected communities as well as the names, and phone numbers of the proposed well managers.
- 2. Contacting the proposed well managers: All the well managers listed were contacted via phone call over a period of five days. Some challenges were encountered in linking up with many of them due to limited network services in the rural communities where many of them reside. However, all of them were reached.
- 3. Visitation of the site and interview: All the sites for the boreholes were visited in order to interact with the community members. The well managers were also interviewed.
- 4. Obtaining pictures of boreholes drilled in target communities during the commissioning: Pictures were taken at each location of the borehole with members of the community during the commissioning by Rev. Fr. Peter Omogo.
- 5. Key informant interview of the well managers and other community members: All the well managers were met by the Assessment Team led by Prof Jesse Uneke, the Project Consultant.
- 6. All the Managers and a few of their companions were interviewed using a data collection instrument which contained the following information:
- (i). Name/occupation/phone no. of proposed borehole manager/respondent (ii).. How long has the respondent lived in community.
- (iii). Water borne diseases prevalent in the village before sinking of borehole
- (iv). Are these water borne diseases still prevalent now?
- (v). Distance children and women walk to get water before the sinking of the borehole
- (vi). How long it takes people to wait at the nearest borehole, well, streams/ponds
- (vii). Has the sinking of the borehole improved the lives of members of this community?
- (viii). Briefly describe how the borehole has (or has not) improved the lives of members of the community?
- (ix). What do you think can be done by the community to maintain this borehole to keep it functional?
- (x). What are your comments to the providers of the borehole to this community?
- 7. **Presentation of the findings**: Each community profile was presented separately on the assessment form with the pictures of the site for each community.

#### **Summary of key findings**

The summary of key findings are as follows:

- 1. Water scarcity is clearly a very serious problem in all the communities listed.
- 2. The communities all have sizable population with average household comprising up to 10persons.
- 3. The main sources of water supply are pond, rivers and streams and these are about 1hr to as much as three hours of walking distance away from the villages.
- 4. Majority of the water sources are being contaminated by sewage (faeces and urine), animal dung, refuse and plat debris and leaves. The possibility of chemical contaminants cannot be ruled out as some people wash clothes and other items capable of polluting the water sources right inside the water.
- 5. The major risks reported include snake bites, attack by hoodlums and thieves, rape of women and girls, molestation by wild animals including monkeys, children going to school late and with dirty uniforms and fighting at the water source.
- 6. Majority of the members of the communities access the water sources on foot.
- 7. The water obtained from all the sources were described as unacceptable.
- 8. The women and the children are mainly responsible for fetching of the water in all the communities.
- 9. All the water sources dry up towards the beginning of the dry season especially around November-April each year.
- 10. The major water-borne diseases suffered by the people as a result of water scarcity include: Typhoid, Cholera and dysentery. Before the provision of the boreholes, the prevalence of these diseases was very high and there were regular outbreaks of these diseases in the target communities.
- 11. All the community members and well managers interviewed acknowledged that the boreholes have greatly alleviate the suffering of their people, reduced exposure to disease causing water-borne infectious agents and enhanced personal hygiene.
- 12. All the managers noted that adequate arrangements have been made to manage and maintain the boreholes since they were drilled. Some of the maintenance activities initiated by the managers and the communities included: constituting a borehole management committee, providing security to monitor and regulate the usage of the boreholes.
- 13. The commissioning of the boreholes was successful and beneficiaries express gratitude to the philanthropists who provided the boreholes to them through the Samuel Omogo Foundation.

## Cases of reported water borne diseases at the Ngbo Court health Centre

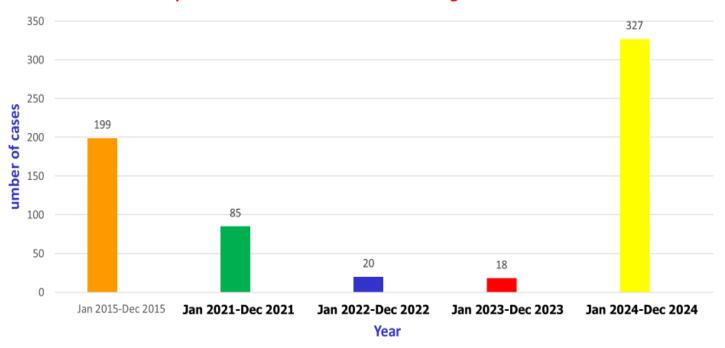

Fig 1. Assessment of cases of water borne diseases comparing January 2015 to December 2015, January 2021 to December 2021, January 2022 to December 2022, January 2022 to December 2023, January 2024 to December 2024 (From Main Health Centre in the locality).

#### **Key findings**

Information obtained on cases reported at the major health facilities in the area (Ngbo Court Health Centre) in Ohaukwu LGA diagnosed as water borne disease presenting as typhoid or cholera with symptoms of diarrhea, dysentery, vomiting. i.e., comprehensive assessment from January 2024 to December 2024, showed an increase to 327 cases from the previous 18 cases reported in 2023.

Year	Cases of water borne diseases
